

ABSTRACT OF THE DISCLOSURE

A packaging and dispensing device (1) includes a reservoir (2), an ejecting assembly (5) supported on one wall (4) of the reservoir and provided with an actuating member (7, 9, 19) exiting from the reservoir, said actuating member being adapted to be moved along a so-called vertical direction, linking elements (32, 31, 30) including one first end (23) linked to the actuating member and a second end (30) linked to an outlet member (24, 29) and which are deformable between the first and second ends to be able to drive a certain amount of product up to the outlet member. From at least one of the ends, the linking elements include at least one end portion (23, 30) oriented so as to be spaced apart from a zone (B) in the form of a vertical planar strip containing a geometrical line directly connecting the actuating member and the outlet member.
